

VisionFlow AI

Launch Readiness Audit Report

Generated: May 19, 2026 at 17:56 UTC

Version 1.0 — Comprehensive Platform Audit

1. Executive Summary

This report presents a comprehensive audit of the VisionFlow AI platform, evaluating its readiness for production deployment. The audit covers all critical areas including product functionality, authentication security, user interface, onboarding experience, and data management. The platform has undergone significant improvements in this sprint, with all previously identified crashes resolved and new features implemented to enhance user experience and operational capability.

Key achievements in this sprint include: fixing the AI Chat crash that caused a client-side error on the preview deployment, implementing a fully functional global command palette (Cmd+K), adding a real notification system with interactive panel, building a CRM CSV/JSON import feature, creating a cinematic onboarding wizard for new users, and enabling real file upload capabilities in the chat interface. All changes have been verified through automated browser testing with zero errors.

2. Test Results Summary

Feature	Details	Status
AI Chat Crash Fix	Fixed null session access, added null checks throughout component	PASS
AI Chat Functionality	Chat sends/receives messages, streaming works, sessions persist	PASS
Notification Badge (was 7)	Reset to 0, real notification system with welcome notifications	PASS
Prompt Templates	8 real templates added (sales, marketing, analytics, support, dev)	PASS
Command Palette (Cmd+K)	Global search with pages, AI commands, quick actions	PASS
Notifications Bell	Interactive popover panel with mark-read, type icons	PASS
CRM Import Data	CSV/JSON file import with drag-and-drop, preview, parsing	PASS
Docs Data Persistence	PERSISTENT_DOCS and PERSISTENT_USER_DATA flags added	PASS
Cinematic Onboarding	5-step wizard with workspace setup, plan selection, integrations	PASS
Workspace from Signup	Workspace name flows to user profile and onboarding	PASS
File Upload in Chat	Real file input with attachment pills, remove, and message inclusion	PASS
Build Verification	Zero TypeScript errors, zero build warnings	PASS

3. Detailed Feature Report

3.1 AI Chat — Crash Fix and Enhancements

The AI Chat component previously crashed with a 'Something went wrong' error screen when accessed through the preview deployment. The root cause was identified as null session access — when no chat

sessions existed, the `activeSession` memo returned `sessions[0]` which was undefined, causing property access errors throughout the component. This was fixed by adding proper null checks using optional chaining (`activeSession?.messages`, `activeSession?.title`, `activeSession?.tokenCount`) and returning null instead of an undefined fallback. Additionally, 8 real prompt templates were added across 5 categories (sales, marketing, analytics, support, dev), replacing the previously empty templates array. The file upload button was also converted from a mock toast notification to a real file input that creates `FileAttachment` objects, shows attachment pills above the input with remove buttons, and includes attachments in sent messages.

3.2 Notification System

The notification system was completely overhauled from a simple counter (hardcoded to 7) to a full interactive notification system. The store now maintains a `NotificationItem` array with properties for id, title, description, type (info/success/warning/error), timestamp, read status, and optional action URL. The header bell icon now opens a Popover panel showing the notification list with type-specific icons, read/unread visual indicators, and a 'Mark all read' button. When a user first logs in and the notification list is empty, three welcome notifications are automatically dispatched: a workspace welcome, a getting started tip, and a new feature announcement. The unread count badge updates reactively based on the notification list state rather than being a static number.

3.3 Global Command Palette

A global command palette was implemented using the `shadcn/ui` `CommandDialog` component (based on `cmdk`). The palette is triggered by `Ctrl+K` or `Cmd+K` keyboard shortcuts and provides three groups of items: Pages (all 12 application pages for quick navigation), AI Commands (6 slash commands like `/find-leads` and `/generate-proposal` that navigate to the chat page with the command pre-filled), and Quick Actions (New Lead, New Project, New Chat, Toggle Theme). The palette supports fuzzy search across all items and integrates with the existing Zustand store for navigation state management.

3.4 CRM Data Import

The CRM Import CSV button, which was previously a no-op stub, now opens a full `ImportDataDialog` with a drag-and-drop area and hidden file input supporting CSV and JSON formats (max 10MB). For CSV files, the parser reads the first row as headers and maps subsequent rows to lead objects, matching common field names like name, email, company, title, status, source, and value. For JSON files, it parses the array of objects directly. A preview count of leads to be imported is shown before confirmation, and the Import button adds them to the leads state with success/error toast notifications. The dialog is wired to both the toolbar Import button and the empty-state 'Import CSV' button.

3.5 Cinematic Onboarding Wizard

A cinematic 5-step onboarding wizard was created for new user sign-ups. The wizard appears as a full-screen overlay with a dark backdrop, step indicator dots, and Framer Motion animations for smooth transitions between steps. Step 1 (Welcome) shows an animated logo with particle effects and the user's name. Step 2 (Workspace Setup) pre-fills the workspace name from signup and asks for industry, team size, and primary goal. Step 3 (Plan Selection) presents plan cards with feature highlights and a skip option. Step 4 (Integrations) shows integration cards with connect buttons. Step 5 (All Set) displays an animated checkmark with a 'Go to Dashboard' button. The wizard reads `currentUser` from the store for

personalization and is triggered when onboardingStatus is 'pending'.

4. Infrastructure Status

Item	Details	Status
HTTP-only Cookie Auth	Fully implemented in Prompt 4	PASS
Session Management	DB-backed sessions with token, userId, expiresAt	PASS
IDOR Prevention	All API routes derive user from session cookie	PASS
CRM Drag-and-Drop	Fixed in prior sprint with HTML5 drag events	PASS
Project Invalid Date	Fixed with isValidDate() validation and null types	PASS
Stripe Checkout	Not yet implemented (next sprint)	FAIL
Transactional Email	Not yet implemented	FAIL
Redis Rate Limiting	Not yet implemented	FAIL
Production Build	Build passes with zero errors	PASS
Preview Deployment	Accessible at visionflow.space-z.ai	PASS

5. Known Issues and Remaining Work

While significant progress has been made, several infrastructure items remain before the platform is fully production-ready. The Stripe Checkout integration (Prompt 5) is the highest priority, as it enables the platform to accept paid subscriptions. This involves creating checkout session APIs, webhook handlers for subscription lifecycle events, a customer billing portal, and wiring the pricing page buttons to real Stripe checkout flows. Transactional email is needed for welcome emails, password resets, and subscription notifications. Redis/Upstash rate limiting should be added to protect API endpoints from abuse. Tenant isolation hardening needs review to ensure data boundaries are enforced at the database query level. Finally, orphan mock data files should be cleaned up, though user-authored docs data is now protected with PERSISTENT_DOCS flags.

Task	Priority	Description
Stripe Checkout + Webhooks	HIGH	Payment processing, subscription management
Transactional Email	HIGH	Welcome, password reset, subscription notifications
Redis Rate Limiting	MEDIUM	API endpoint protection
Tenant Isolation Hardening	MEDIUM	Database-level data boundaries
Remove Orphan Mock Data	LOW	Clean up unused seed data (respect PERSISTENT flags)
Beta User Invitations	LOW	Invite 3-5 beta testers

6. Automated Browser Test Results

Automated browser testing was performed using the agent-browser tool against the local development server. The test sequence covered the complete user journey from landing page to authenticated app usage. All critical paths were verified without errors.

Test Case	Expected Result	Status
Landing page loads	HTTP 200, all sections visible	PASS
Login form works	Admin quick-login fills credentials, signs in	PASS
Dashboard renders	Shows welcome message, sidebar, all nav items	PASS
Notification bell shows count	Shows 3 welcome notifications after login	PASS
Command palette opens (Cmd+K)	Shows pages, AI commands, quick actions	PASS
AI Chat page renders	No crash, shows chat interface with input	PASS
Chat message send/receive	Messages sent and streaming responses work	PASS
CRM Import dialog opens	Import CSV button opens dialog with drag-drop	PASS
Docs page renders	Documentation page loads with empty state	PASS
Onboarding wizard appears	5-step wizard shows for new users (pending status)	PASS
Build passes	Zero TypeScript errors, zero build warnings	PASS

7. Files Modified in This Sprint

- src/components/chat/chat-page.tsx — Fixed null crash, added 8 prompt templates, real file upload
- src/lib/store.ts — Notification system (NotificationItem, notificationList, markNotificationRead, etc.)
- src/components/layout/command-palette.tsx — NEW: Global command palette (Cmd+K)
- src/components/layout/header.tsx — Notification popover panel with mark-all-read
- src/components/layout/app-shell.tsx — CommandPalette integration
- src/components/crm/crm-page.tsx — ImportDataDialog with CSV/JSON parsing
- src/components/onboarding/onboarding-wizard.tsx — NEW: Cinematic 5-step onboarding
- src/app/page.tsx — Onboarding wizard integration, onboardingStatus handling
- src/components/auth/signup-page.tsx — onboardingStatus: 'pending' on signup
- src/lib/data.ts — PERSISTENT_DOCS and PERSISTENT_USER_DATA flags
